TITLE: On the Problem of the Analytical Continuation of the Fundamental Solutions of an Equation of Hyperbolic Type With Singular Coefficients (K zadache analiticheskogo prodolzheniya glavnykh resheniy uravneniya giperbolicheskogo tipa s osobymi koeffitsiyentami).

PERIODICAL: Doklady Akademii Nauk SSSR, 1957, Vol. 116, Nr 2, pp. 167-170 (USSR)

ABSTRACT: In the semiplane $y > x$ the equation

$$(1) (y-x)z_{xy} + B(z_x - z_y) + c(x,y)z = 0, \quad c(x,y) \geq 0, \quad 0 < B < \frac{1}{2}$$

is considered, where $c(x,y) = \sum_{k=0}^{\infty} c_{2k}(y-x)^{1+2k}$, $c_{2k} = \text{const.}$

Let \bar{D} be a closed domain which is limited by the interval MN of the line $y=x$ and by the characteristics MP and NP of (1) starting in $M(x_1, x_1)$ and $N(x_2, x_2)$. Let $\tau(x)$ and

$\nu(x)$ be 2-times continuously differentiable functions

$(x_1 \leq x \leq x_2)$. Let $4c(x,y) = b^2(y-x)$, $b = \text{const.}$ Theorem:

For (1) there exist unique solutions of the singular Cauchy problem

CARD 1/4

On the Problem of the Analytical Continuation of the
Fundamental Solutions of an Equation of Hyperbolic Type With Singular
Coefficients

20-2-1/50

(2) $z(x, x) = \tau(x)$, $z_{\xi}(x, x) = \nu(x)$, $\xi = -(\frac{y-x}{2-2a})^{1-a}$, $a = 2B$
and of the Tricomi problems

(3) $z(x_1, y) = 0$, $z_{\xi}(x, x) = \nu(x)$; $z(x_1, y) = 0$,
 $z(x, x) = \tau(x)$, $\tau(x_1) = 0$

which are 2-times continuously differentiable in D. These
solutions continuously depend on $\tau(x)$ and $\nu(x)$, whereby all
the three problems are correct of order zero (see [3] Frankl).
Theorem: The solution of (1) - (2) has the form

$$z_0 = \gamma_1 (y-x)^{1-a} \int_x^y \tau(x') [(x'-x)(y-x')]^{B-1} R_{B-1}(x'-x, y-x') dx' - \\ - \gamma_2 \int_x^y \nu(x') [(x'-x)(y-x')]^{-B} R_{-B}(x'-x, y-x') dx'$$

The solutions of the problems (1) - (3) are

$$z_1 = \gamma \int_{x_1}^x \nu(x') [(x-x')(y-x')]^{-B} \tilde{R}_{-B}(x-x', y-x') dx'$$

CARD 2/4

On the Problem of the Analytical Continuation of the
Fundamental Solutions of an Equation of Hyperbolic Type With Singular
Coefficients

20-2-1/50

$$z_2 = k(y-x)^{1-a} \int_{x_1}^x \tau(x') [(x-x')(y-x')]^{B-1} \bar{R}_{B-1}(x-x', y-x') dx'$$

Here it is $\gamma_1 = \Gamma(a)/\Gamma^2(B)$; $\gamma_2 = \Gamma(2-a)/\Gamma^2(1-B)$;

$k = \Gamma(1-B)/\Gamma(B)\Gamma(1-a)$, $\gamma = k\gamma_2/\gamma_1$; R_γ and \bar{R}_γ are double
power series with infinite radii of convergence, for $x'=x$
and $x'=y$ it is $R_\gamma = \bar{R}_\gamma = 1$. If

$$(4) \quad R_{-B}(x'-x, y-x') = \sum_{\gamma=0}^{\infty} \sum_{B=0}^{\infty} a_{\gamma B} (x'-x)^\gamma (y-x')^B \quad (a_{\gamma B} = \text{const}, a_{00} = 1)$$

then $R_{B-1}(x'-x, y-x')$ arises, if in (4) B is replaced by
 $1-B$. The functions R_{-B} , R_{B-1} are strictly positive in $y > x$
and satisfy the inequalities

$$R_{-B}(P) \leq \bar{I}_{-B}(br) \quad , \quad R_{B-1}(P) \leq \bar{I}_{B-1}(br) \quad , \quad \text{where}$$

CARD 3/4

On the Problem of the Analytical Continuation of the
Fundamental Solutions of an Equation of Hyperbolic Type With Singular
Coefficients 20-2-1/50

$$r = \sqrt{(x'-x)(y-x')} \quad , \quad P = P(x'-x, y-x') \quad \text{and} \quad b = 2\sqrt{\sup_{y>x} \frac{c}{y-x}} \quad .$$

The proofs of the two theorems are based on the application of the fundamental solutions previously found by the author [1] , [2] .

Numerous conclusions are drawn from the theorems which are particularly applied to the analytical continuation of the fundamental solutions.

Kapilevich, M.B.

SOV/20-125-1-4/57

TITLE:

On the Uniqueness Theorems of the Singular Problems of Dirichlet-Neumann (K teoremam yedinstvennosti singulyarnykh zadach Dirikhle-Neymana)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 1, pp 23-26 (USSR)

ABSTRACT: In the halfplane $y \geq 0$ the author considers the equation

$$(1) \quad u_{xx} + u_{yy} + \frac{a(r)}{y} u_y + F(r)u = 0,$$

where it is assumed that $a(r) > 0$ and $F(r)$, $r = \sqrt{x^2 + y^2}$, for $y > 0$ are bounded and continuous, where in the neighborhood of $r = 0$:

$a(r) = \sum_{s=0}^{\infty} a_s r^s$, $F(r) = \frac{b_0}{r} + \sum_{s=0}^{\infty} b_{s+1} r^s$, $0 < a_0 < 1$. Let u and \bar{u} be two solutions for which $u_\eta(x, 0) = \bar{u}(x, 0) = 0$, $u(0, 0) \neq 0$, $\bar{u}_\eta(0, 0) \neq 0$, $\eta = \left(\frac{y}{1-a_0}\right)^{1-a_0}$.

Theorem: Let $M(r)$ be an integral of the equation $rM_{rr} + [1+a(r)]M_r + rF(r)M = 0$ which is bounded in $r = 0$, and $M(0) = 1$.

Card 1/2

On the Uniqueness Theorems of the Singular
Problems of Dirichlet-Neumann

SOV/20-125-1-4/67

Then all solutions $u(x,y)$ of (1) belonging to the class \mathcal{L}_2

for $y \geq 0$, satisfy the relation $M(r)u(0,0) = D \int_0^\pi u(r \cos \theta,$

$r \sin \theta) \sin^{a(r)} \theta d\theta$, where $\sqrt{\pi} \Gamma(\frac{1}{2} + \beta) D = \Gamma(1 + \beta)$, $a_0 = 2\beta$.

A similar theorem holds for the mean value of \bar{u} . The theorems are used in order to prove a uniqueness theorem for the singular Dirichlet-Neumann problem for (1) for non-positive $F(r)$. There are 6 references, 4 of which are American, 1 German, and 1 Swedish.

TITLE: On the Theory of Linear Differential Equations With Two Perpendicular Parabolic Lines (K teorii lineynykh differentsialnykh uravneniy s dvumya perpendikulyarnymi liniyami parabolichnosti)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 2, pp 251-254 (USSR)

ABSTRACT: In $\Omega(x \geq 0, y \geq 0)$ the author considers the equation

$$(1) \quad u_{xx} + u_{yy} + \frac{m(r)}{x} u_x + \frac{n(r)}{y} u_y + F(r)u = 0;$$

$$m(r) = \sum m_s r^s > 0, n(r) = \sum n_s r^s > 0, r = \sqrt{x^2 + y^2}, 0 < m_0 < 1, 0 < n_0 < 1;$$

$F(r)$ is bounded and continuous everywhere in Ω with the exception of the point $r=0$, where $F(r) = b_0 r^{-1} + \sum b_{s+1} r^s$. The author investigates solutions u and \bar{u} for which at the boundary of Ω it holds: $u_{\xi}(0, y) = u_{\eta}(x, 0) = 0, u(0, 0) \neq 0; \bar{u}(0, y) =$

$$= \bar{u}(x, 0) = 0, \bar{u}_{\xi\eta}(0, 0) \neq 0, \text{ where } \xi = \left(\frac{x}{1-m_0}\right)^{m_0}, \text{ and } \eta = \left(\frac{y}{1-n_0}\right)^{1-n_0}.$$

Card 1/2

On the Theory of Linear Differential Equations
With Two Perpendicular Parabolic Lines

SOV/20-125-2-2/64

Theorem: If $M(r)$ is an integral of $rM_{rr} + [1+m(r)+n(r)]M_r + rF(r)M = 0$,
 $M(0) = 1$, then every solution $u(x,y)$ of (1) belonging to L_2 in Ω

satisfies the relation $M(r)u(0,0) = \delta \int_0^{\frac{\pi}{2}} u(r \cos \theta, r \sin \theta) \sin^{n(r)} \theta \cos^{m(r)} \theta d\theta$, where $\Gamma(\frac{1}{2} + \mu) \Gamma(\frac{1}{2} + \nu) \delta = 2\Gamma(1 + \mu + \nu)$, $2\mu = m_0$, $2\nu = n_0$.

Two further similar theorems and a series of special cases are given.

There are 6 references, 3 of which are Soviet, 1 Italian, 1 Swedish, and 1 German.

TITLE: On the Theory of Degenerated Elliptic Differential Equations of the Bessel Class (K teorii vyrozhdayushchikhsya ellipticheskikh differentsial'nykh uravneniy klassa Besselya)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 4, pp 719-722 (USSR)

ABSTRACT: In $x \geq 0$, $y \geq 0$, $z \geq 0$ the author considers the equation

$$(1) \quad \Delta u + \frac{k}{x} u_x + \frac{m}{y} u_y + \frac{n}{z} u_z + F(r)u = 0 ;$$

$0 < k < 1$, $0 < m < 1$, $0 < n < 1$, $r^2 = x^2 + y^2 + z^2$, $F(r)$ bounded and continuous except of the point $r=0$, in the neighborhood of which

$$F(r) = \frac{b_0}{r} + \sum_{s=0}^{\infty} b_{s+1} r^s .$$

In six theorems formulated without proof and three extended tables for the values of the appearing constants the author considers several properties and the correlations of the solutions $u^{(s)}$ ($s = 0, 1, \dots, 7$) of (1). By the introduction of an averaging operator the author investigates especially the

Card 1/2

On Mean Value Theorems for the Solutions of Singular Elliptic
Differential Equations

$$(1.3) \quad u_\eta(x,0) = 0, \quad U(x,0) = 0, \quad \eta = \left(\frac{y}{1-a} \right)^{1-a}$$

on the semicircles $\Gamma(0,r) : x^2 + y^2 = r^2, y \geq 0, 0 \leq r < \infty$. Let

$$(1.4) \quad x = r \cos \alpha, \quad y = r \sin \alpha, \quad 0 \leq r < \infty, \quad 0 \leq \alpha \leq \pi.$$

and $R(r) = \int_0^\pi u \sin^a \alpha d\alpha$. Let $M(a, F, r)$ be that solution of the
equation

$$(1.6) \quad G(a, F, R) = R_{rr} + \frac{1+a}{r} R_r + F(r)R = 0$$

which corresponds to the characteristic exponent $\xi_1 = 0$ and which satisfies
the condition

$$(1.7) \quad M(a, F, 0) = 1.$$

Then it holds

Card 2/6

88183

S/140/60/000/006/009/018

C111/C222

On Mean Value Theorems for the Solutions of Singular Elliptic
Differential Equations

$$(1.8) \quad M(a, F, r)u(0,0) = D \int_0^{\tilde{\pi}} u(r \cos \alpha, r \sin \alpha) \sin^a \alpha d\alpha$$

$$\text{where } D = \frac{\Gamma(1+B)}{\sqrt{\pi} \Gamma(\frac{1}{2}+B)}, \quad B = \frac{a}{2}.$$

An analogous formula is given for $\tilde{\pi}$. The author discusses the special
cases

$$(1.12) \quad F(r) = -b^2$$

((1.6) is then a Bessel equation) and

$$(1.17) \quad F(r) = \frac{c}{r} - b^2$$

(here M is a confluent hypergeometric function).
Then the equation

$$(2.1) \quad u_{xx} + u_{yy} + \frac{m}{x} u_x + \frac{n}{y} u_y + F(r)u = 0$$

Card 3/6

88183

C111/C222

On Mean Value Theorems for the Solutions of Singular Elliptic
Differential Equations

is investigated, where $0 < m < 1$, $0 < n < 1$, and $F(r)$ is the same as above.
In the region Ω ($x \geq 0, y \geq 0$), the author considers solutions u and \bar{u}
which, on the boundary of Ω , satisfy the conditions

$$u_{\xi}(0, y) = u_{\eta}(x, 0) = \bar{u}(0, y) = \bar{u}(x, 0) = 0$$

$$\xi = \left(\frac{x}{1-m} \right)^{1-m}, \quad \eta = \left(\frac{y}{1-n} \right)^{1-n}$$

It is stated that it holds

$$(2.2a) \quad M(m, n, F, r) u(0, 0) = \delta_1 \int_0^{\frac{\pi}{2}} u(r \cos \alpha, r \sin \alpha) \sin^n \alpha \cos^m \alpha d\alpha$$

$$(2.2b) \quad r^{2-m-n} M(m, n, F, r) \bar{u}_{\xi\eta}(0, 0) = \delta_2 \int_0^{\frac{\pi}{2}} \bar{u}(r \cos \alpha, r \sin \alpha) \sin 2\alpha d\alpha$$

Here the function M is given by (1.6) and (1.7) for $a = m+n$, while

Card 4/6

On Mean Value Theorems for the Solutions of Singular Elliptic
Differential Equations

$$\begin{aligned} \bar{M} &= M(2-m, 2-n, P, r), \quad 2\mu = m, \quad 2\nu = n, \quad \delta_1 \Gamma\left(\frac{1}{2} + \mu\right) \Gamma\left(\frac{1}{2} + \nu\right) = \\ &= 2 \Gamma(1 + \mu + \nu), \quad 2(1-m)^{1+m} (1-n)^{1+n} \Gamma\left(\frac{1}{2} - \mu\right) \Gamma\left(\frac{1}{2} - \nu\right) \delta_2 = \\ &= (4-m-n)(2-m-n)^2 \Gamma(1-\mu-\nu). \end{aligned}$$

Introducing in (2.1) the variables ξ, η then one obtains

$$(2.3) \quad \eta^p u_{\xi\xi} + \xi^q u_{\eta\eta} + \xi^q \eta^p P(r)u = 0$$

where $(1-n)p = 2n$, $(1-m)q = 2m$. Let Δ_2 denote the region bounded by

$\Gamma_2: \quad \rho^2 = x^2 + y^2 = R^2, \quad x \geq 0, \quad y \geq 0$ and the lines OA and OB of the
axes $x = 0, y = 0$ ($A = A(R, 0)$, $B = B(0, R)$). In Δ_2 the author considers
solutions u, \bar{u} of (2.3) which, on the boundary of Δ_2 , satisfy the
conditions

$$(2.4a) \quad u|_{\rho=R} = f(\xi), \quad u_\xi(0, \eta) = \nu_1(\eta), \quad u_\eta(\xi, 0) = \nu_2(\xi)$$

Card 5/6

AUTHOR: Kapilevich, M.B.

TITLE: Transformation Operators Connected With Goursat Singular Problems

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol 130, Nr 3, pp 487 - 490 (USSR)

ABSTRACT: Let $L_p^q(b)$ ($p, q = 0, 1, 2, \dots, \infty$) be the set of the functions $f(y)$ which are defined on $\delta: 0 \leq y \leq y_0$ and p -times continuously differentiable with

$$(1) \quad f(0) = f'(0) = \dots = f^{(q)}(0) = 0.$$

As the first singular Goursat problem G_p^q the determination of the solutions $z(x, y, b)$ of

$$(2) \quad xz_{xy} + az_x + bz_y = 0 \quad (a \geq 0, b \geq 0)$$

is denoted which are continuous in $D (0 \leq x \leq x_0, 0 \leq y \leq y_0)$ together with their p -th derivatives and for which

Card 1/5

67901

Transformation Operators Connected With Goursat Singular Problems SOV/20-130-3-1/65

$$(3) \quad z(0,y) = f(y) \quad , \quad z(x,0) = 0 \quad , \quad f(y) \in L^q_p(\delta) \quad .$$

Theorem 1 : Let $b_2 > b_1 \geq 0$, $b = b_2 - b_1$, $p \geq 2$, $q \geq 0$. Then it is

$$(4) \quad z(x,y,b_2) = \frac{1}{(b)} \left(\frac{a}{x}\right)^b \int_0^y (y-t)^{b-1} e^{-a(y-t)/x} z(x,t,b_1) dt \quad .$$

To this equation there corresponds in the case $p=n$, $q \geq 0$ the expansion

$$(5a) \quad z(x,y,b_2) = \frac{1}{(b)} \sum_{k=0}^n \frac{1}{k!} \left(-\frac{x}{a}\right)^k \gamma(b+k, \frac{ay}{x}) D_y^k z(x,y,b_1) + R_n$$

where $\gamma(\cdot, u)$ is the incomplete Eulerian Gamma function

[Ref 2], $\gamma_y^k = \partial^k \gamma / \partial y^k$ and, if $\eta = y - \theta t$, $0 < \theta < 1$,

then it is

Card 2/5

67901

Transformation Operators Connected With Goursat
Singular Problems

SOV/20-130-3-1/65

$$(5b) R_n = \frac{(-1)^{n+1}}{(n+1)! \Gamma(b)} \left(\frac{a}{x}\right)^b \int_0^y t^{n+b} e^{-at/x} D_\eta^{n+1} z(x, \eta, b_1) dt$$

Theorem 2 : For every $f(y) \in L_p^q(\mathcal{S})$ ($p \geq 2, q \geq 0$) for $b_1, b_2 > 0$,
 $\bar{b} = b_1 - b_2$, $c_0 \Gamma(\bar{b}) \Gamma(b_2) = \Gamma(b_1)$ there hold the formulas

$$(6a) z(x, y, b_2) = c_0 \int_0^1 t^{b_2-1} (1-t)^{\bar{b}-1} z(xt, y, b_1) dt.$$

Moreover in theorem 1 the author gives a simpler form for (5a) for the case $p = n, q \geq n$. Moreover in theorem 2 he gives the expansion for $z(x, y, b_2)$ and the corresponding remainder term as in theorem 1.

Let $v(x, y, b)$ be the solution of the problem (3) (for $p=2, q=0$) for the parabolic equation

$$(7) x v_{xx} + b v_x - a v_y = 0 \quad (a > 0),$$

Connection Formulas for Singular Tricomi Problems

S/020/60/132/01/06/064

$\alpha_1 \Gamma(\beta) \Gamma(1/2 - \beta_2) = 2^{\beta} \Gamma(1/2 - \beta_1)$ it holds :

$$(4) \quad u(x, y, \beta_2) = (y-x)^{1-\beta_1-\beta_2} \int_0^x K_1(x, y, \xi, \beta_1, \beta_2) u(\xi, y, \beta_1) d\xi,$$

where $K_1 = \alpha_1 (y-\xi)^{\beta_1-1} (x-\xi)^{\beta_2-1} \Gamma(-\beta, \beta_2, \beta_1, \omega)$.

Then the considered Tricomi problem is compared with the solutions of singular Goursat - problems (Ref.1) for $y z_{xy} + \alpha z_y + \beta z_x = 0$ as well as with $y v_{yy} + \beta v_y - \alpha v_x = 0$. The author gives a series of transformation formulas. The results can be used in order to solve explicitly the considered boundary value problems in special cases.

AUTHOR: Kapilevich, M.B.

TITLE: Tricomi's singular problems in the neighborhood of a finite and infinite singular line

PERIODICAL: Akademiya nauk SSSR. Doklady, vol. 137, no. 5, 1961, 1053-1056

TEXT: In the region G ($0 \leq x \leq y \leq x_0$) the author considers the equation

$$E(u, \beta, \beta') = (y-x)u_{xy} + \beta'u_x - \beta u_y = 0. \quad (1)$$

The functions $u(x, y, \beta, \beta')$ and $\bar{u}(x, y, \beta, \beta')$ are called solutions of the first and second singular problem of Tricomi if (correspondingly) the boundary conditions

$$u(x, x) = \tau(x), \quad u(0, y) = \tau(0) = 0; \quad \bar{u}_n(x, x) = \nu(x), \quad \bar{u}(0, y) = 0 \quad (2)$$

are satisfied. Let $\tau(x)$ and $\nu(x)$ be two times continuously differentiable on $(0, x_0)$. Let $\eta = -[(y-x)/(2-a-a')]^{1-\alpha}$, $\alpha = \beta + \beta' < 1$, $a = 2\beta$, $a' = 2\beta'$.

By the introduction of the variables $x = x$, $s = y-x$, (1), (2) is reduced to

$$F(u, \beta', \alpha) = s(u_{xs} - u_{ss}) + \beta'u_x - \alpha u_s = 0; \quad (3)$$

Card 1/5

21965

S/020/61/137/005/008/026
C111/C222

Tricomi's singular problems...

$$u(x,0) = \tau(x), \quad u(0,s) = \tau(0) = 0; \quad \bar{u}_\eta(x,0) = v(x), \quad \bar{u}(0,s) = 0, \quad (4)$$

where $u(x,s)$ is the new sought function.

If $U(x,s)$ and $\bar{U}(x,s)$ are integrals of (3) corresponding to the boundary conditions $U(x,0) = \bar{U}_\eta(x,0) = 1$, $U(0,s) = \bar{U}(0,s) = 0$ then

$$u(x,s) = D_x \int_0^x U(x-\xi, s) \tau(\xi) d\xi - \int_0^x U(x-\xi, s) d\tau(\xi); \quad (5a)$$

$$\bar{u}(x,s) = D_x \int_0^x \bar{U}(x-\xi, s) v(\xi) d\xi - \int_0^x \bar{U}(x-\xi, s) dv(\xi). \quad (5b)$$

The discontinuous Duhamel kernels $U(x,s)$, $\bar{U}(x,s)$ are expressed by the modified incomplete Beta-functions $I_z(p,q)$ which are tabulated (Ref.1:

K.Pearson, Tables of the incomplete Beta-function, Cambridge, 1904). The Duhamel resolvents of

$$(y-x)u_{xy} + \beta(u_x - u_y) - b^2(y-x)u = 0 \quad (7)$$

are also expressed by the same functions. For this in (7) it must be put $s = y-x$, $t = x/y$, $u = s^{-p}v$, and in the appearing equation it must be put

Card 2/5

Tricomi's singular problems...

S/020/61/137/005/008/026
C111/C222

$v = \sum_{n=0}^{\infty} s^{\beta+n} f_n(t)$. That yields the recurrent system

$$T(1-t)^2 f_{m+2}''(t) - (1-t)[m+\beta+1+(m+\beta+3)t] f_{m+2}'(t) + \\ + (m+2)(m+2\beta+1) f_{m+2}(t) + b^2 f_m(t) = 0, \quad (8)$$

where $m = -2, -1, 0, 1, 2, \dots$, $f_{-2}(t) \equiv f_{-1}(t) \equiv 0$.

From (5) it follows $\lim_{s \rightarrow \infty} [s^{\beta'} u] = \Gamma(1-\beta)/\Gamma(1-\alpha) D_x^{-\beta'} C(x) = T(x)$. Putting

$\zeta = 1/s$, $w = s^{\beta'} u$, then (3), (4) is reduced to

$$w_{x\zeta} + \zeta^2 w_{\zeta\zeta} + (\beta' - \beta + 2) \zeta w_{\zeta} + \beta'(1-\beta)w = 0, \quad (9)$$

$$w(x, 0) = T(x), \quad w(0, \zeta) = 0, \quad T(0) = 0. \quad (10)$$

Theorem 1: For $\beta'_1 > \beta'_2 > 0$, $\beta' = \beta'_1 - \beta'_2$, $\Gamma_1 \Gamma(\beta'_2) \Gamma(\beta') = \Gamma(\beta'_1)$ the solutions $w_k = w(x, \zeta, \beta, \beta'_k)$ ($k=1, 2$) are connected by the relation

$$w(x, \zeta, \beta, \beta'_2) = \Gamma_1 \int_0^1 \zeta^{\beta'_2-1} (1-\xi)^{\beta'-1} w(x, \xi \zeta, \beta, \beta'_1) d\xi \quad (12)$$

Card 3/5

21965

Tricomi's singular problems...

S/020/61/137/005/008/026.
C111/C222

to which in the case $T(x) \subset C_{n+1}$ ($0 \leq x \leq x_0$) there corresponds the development

$$w(x, \sigma, \beta, \beta') = \sum_{h=0}^n \frac{(\beta')_h}{(\beta_1)_h} h! (-\sigma)^h D_x^h w(x, \sigma, \beta, \beta') + R_n, \quad (13)$$

where

$$R_n = \frac{(-1)^{n+1} \Gamma(\beta_1')}{\Gamma(\beta') \Gamma(\beta_1' + n + 1)} \times$$

$$\times \int_0^{\sigma} \xi^{\beta_1' + n} F(1 - \beta', \beta_1', \beta_1' + n + 1, \xi) D_x^{n+1} w(x, \xi \sigma, \beta, \beta') d\xi.$$

Theorem 2: For $0 \leq \beta_1 < \beta_2 < 1$, $\beta = \beta_2 - \beta_1$, $\mu_2 \Gamma(1 - \beta_2) \Gamma(\beta) = \Gamma(1 - \beta_1)$ it holds

$$w(x, \sigma, \beta_2, \beta') = \mu_2 \int_0^1 \xi^{-\beta_2} (1 - \xi)^{\beta - 1} w(x, \xi \sigma, \beta_1, \beta') d\xi. \quad (14)$$

The confluent case $x \sigma + a \sigma z_0 + a \beta' z = 0$ ($a > 0$) arises from (9) if x is replaced by εx and β is replaced by $-a/\varepsilon$, and $\xi = 0$. The telegraphic Card 4/5

S/020/61/137/005/008/026
C111/C222

Tricomi's singular problems...

equation $v_{x\bar{x}} + c^2 v = 0$ approximates (9) for $c^2 = \rho'(1-\rho)$ in the neighborhood $\bar{c} = 0$.

Theorem 3: For $\beta < 1, \beta' > 0, c > 0, \mu \Gamma(\beta) \Gamma(1-\beta) = 2c^{1+\beta'-\beta}$ the solutions $w(x, \bar{c}, \beta, \beta'), z(x, \bar{c}, \beta')$ and $v(x, \bar{c}, c)$ of the problem (10) transform by

$$w(x, c, \beta, \beta') = \frac{c^{1-\beta}}{\Gamma(1-\beta)} \int_0^\infty \xi^{-\beta} e^{-c\xi} z(x, \xi c, \beta') d\xi,$$

$$w(x, c, \beta, \beta') = \mu \int_0^\infty \xi^{(\beta'-\beta-1)/2} K_{\beta-1}(2c\sqrt{\xi}) v(x, \xi c, c) d\xi.$$

A great number of further connections is given.

AUTHOR: Kapilevich, N. B.

TITLE: Goursat's singular problems in the neighborhood of a zero and infinite singular characteristic

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 137, no. 6, 1961, 1287-1290

TEXT: In $D(0 \leq x \leq x_0, 0 \leq y \leq y_0)$ the author considers

$$L(z, B, C) = x z_{xy} + A(x) z_x + B(x) z_y + C(x) z = 0 \quad (1)$$

where $A(x) > 0$, $B(x)$, $C(x)$ together with the second derivatives are continuous on $X(0 \leq x \leq x_0)$. Let $z(x, y, B, C)$ denote a solution of (1) which is twice continuously differentiable in D and for which it holds

$$z(0, y) = f(y), \quad z(x, 0) = 0, \quad f(0) = 0. \quad (2)$$

As in the paper of the author (Ref.1: DAN 130, No. 3, 487 (1960)), $f(y)$ is assumed to belong to the class C_p^1 on $X(0 \leq y \leq y_0)$.

The principle of Duhamel reads as follows: If $U(x, y)$ is an integral of (1) with discontinuous boundary conditions $U(0, y) = 1$, $U(x, 0) = 0$,
Card 1/6

23844

Goursat's singular problems ...

S/020/61/137/006/003/020
C 111/ C 333

then

$$s(x, y, B, C) = B_y \int_0^y U(x, y - \eta) f(\eta) d\eta = \int_0^y U(x, y, -\eta) df(\eta). \quad (3)$$

If $A(x) \equiv A(0) = a$, $B(x) \equiv B(0) = b$, $C(x) \equiv 0$, i. e. if $s(x, y, B, C) = s(x, y, b)$ satisfies the equation (Ref.1)

$$L(s, b) = x s_{xy} + a s_x + b s = 0 \quad (a > 0) \quad (4)$$

then $U(x, y) \Gamma(b) = Y(b, ay/x)$, where $Y(b, s)$ is the incomplete gamma function. The existence of the discontinuous solution $U(x, y)$ in the general case (1) is proved by successive approximation.

Theorem 1: Let $V(x, y)$ satisfy the equation $xV_{xy} + AV_x + (B_2 - B_1)V_y + (C_2 - C_1)V = 0$ and the discontinuous initial conditions $V(x, 0) = 0$, $V(0, y) = 1$. Let $s_k = s(x, y, B_k, C_k)$ be the solution of the problem (2) for $L(s, B_k, C_k) = 0$ ($k = 1, 2$). If then $b_2 - b_1 > 1$, then

Card 2/6

Goursat's singular problems ...

S/020/61/137/006/003/020

C 111/ C 333

$$s_2(x, y) = D_y \int_0^y v(x, y - \eta) s_1(x, \eta) d\eta = \int_0^y v(x, y - \eta) s_{1\eta}(x, \eta) d\eta. (5)$$

Here the Duhamel resolvents U_1, U_2, V are connected by

$$U_2(x, y - \eta) = D_y \int_0^y v(x, y - t) U_1(x, t - \eta) dt. (6)$$

Theorem 2: Let $s(x, y, b+n+1)$ be the solution of the problem $s(0, y) = (-a)^{-n+1} (b)_{n+1} f^{(n+1)}(y)$, $s(x, 0) = 0$ for the equation $L(s, b+n+1) = 0$, where $f(y) \in C_{n+3}^{n+1}$. Then

$$s(b) = \sum_{k=0}^n (b)_k / k! \left(-\frac{x}{a}\right)^k f^{(k)}(y) + \frac{1}{n!} \int_0^x (x-\xi)^n s(\xi, y, b+n+1) d\xi. (9)$$

Let $s_0(x, y, b, \delta)$ denote the integral of (1) for which

Card 3/6

Goursat's singular problems ...

23844

S/020/61/137/006/003/020
C 111/ C 333

$$s_0(0, y) = f(y), \lim_{y \rightarrow -\infty} s_0(x, y) = 0, f(-\infty) = 0 \quad (10)$$

If $f(y)$ is given everywhere on $-\infty < y < y_0$, then for $b > 0$

$$s_0(x, y, b) = \frac{1}{\Gamma(b)} \left(\frac{a}{x}\right)^b \int_0^y (y-\eta)^{b-1} \exp \left[-\frac{a(y-\eta)}{x} \right] f(\eta) d\eta \quad (11)$$

For investigating $s(x, y, b)$ in the neighborhood of $x = \infty$ the author introduces

$u(x, y, b) = x^{-b} s(1/x, y, b)$ and then he considers

$$\mathcal{L}(u, b) = u_{xy} + auu_x + abu = 0 \quad (12)$$

$$u(0, y) = \phi(y), u(x, 0) = 0, \phi(0) = 0 \quad (13)$$

The solution is obtained from (3), if one passes from $f(y)$ to $\phi(y)$.

Card 4/6

Goursat's singular problems

23814
S/020/61/137/006/003/020
C 111/ C 333

where $\phi(y)$ is defined by $\lim_{x \rightarrow \infty} [x^b s(x, y, b)] = a^b D_y^{-b} f(y) = \phi(y)$.

The solution of (12), (13) then is

$$u(x, y, b) = D_y \int_0^y U(x, y-\eta) \phi(\eta) d\eta = \int_0^y U(x, y-\eta) d\phi(\eta). \quad (14)$$

Let $v(x, y, b)$ be the solution of $xv_{xx} + bv_x - av_y = 0$ ($a > 0$) with the boundary condition (2). The function $v(x, y, b)$ is also representable as Duhamel integral (3) with the kernel $\Gamma(1-b)U(x, y) = \Gamma(1-b, ax/y)$.

Theorem 3: For $a_1 \Gamma(b) \Gamma(1-b_2) = \Gamma(1-b_1)$, $a_2 \Gamma(1-b_1) \Gamma(1-b) = \Gamma(1-b_2)$ and arbitrary set integers $b_1 > 0$, $b_2 > 0$, $b = b_2 - b_1 > 0$, $\bar{b} = b_1 - b_2 > -1$ it holds

$$v(x, y, b_2) = a_1 \int_0^1 \xi^{b_1-1} (1-\xi)^{\bar{b}-1} v(\xi x, y, b_1) d\xi;$$

AUTHOR: Kapilevich, M. B.

TITLE: An effective solution of Tricomi singular problems for Chaplygin's equation

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 141, no. 5, 1961, 1030 - 1033

TEXT: The Chaplygin equation $\eta z_{\theta\theta} + z_{\eta\eta} + b(\eta)z_{\eta} = 0$, where

$b(\eta) = \sum_{m=0}^{\infty} b_m \eta^m$ in the neighborhood of $\eta = 0$, has in the variables

$x = \theta - 2/3(-\eta)^{3/2}$, $y = \theta + 2/3(-\eta)^{3/2}$ for $\eta < 0$ the shape

$$G[z] = z_{xy} + A(z_x - z_y) = 0, \quad (1)$$

$$A = \frac{1}{6s} + \sum_{m=0}^{\infty} a_m s^{(2m-1)/3}; \quad s = y - x; \quad a_m = 1/4(-1)^{m+1}(3/4)^{(2m-1)/3}b_m.$$

The author calls $z(x, y)$ and $\bar{z}(x, y)$ solutions of the first and second singular Tricomi problem, if these functions satisfy in $D(0 \leq x < y \leq x_0)$

Card 1/4

32312

S/020/61/141/005/003/018
C111/C444

An effective solution of Tricomi...

the equation (1) and the boundary conditions

$$z(x, x) = \tau(x), \bar{z}_\eta(x, x) = \nu(x), z(0, y) = \bar{z}(0, y) = 0, \quad (2)$$

where $\tau(0) = 0$, $\tau(x)$ and $\nu(x) \in C^2[0, x_0]$.

According to the author (Ref. 4: DAN 137, no. 5, 1053, 1961) it is sufficient for the solution of (1) - (2) to determine the discontinuous solutions of (1) with the boundary conditions

$$U(x, x) = \bar{U}_\eta(x, x) = 1, \quad u(0, y) = \bar{u}(0, y) = 0. \quad (3)$$

In order to find $U(x, y)$ one puts in (1) $s = y - x$, $t = x/y$ and uses in the originating equation

$$Q[z] = s(1 - t^2)z_{st} - t(1 - t)^2z_{tt} - s^2z_{ss} + [As(1 - t^2) - (1 - t)^2]z_t - 2As^2z_s = 0 \quad (4)$$

the set-up

$$z = U(x, y) = \sum_{n=0}^{\infty} U_n(x, y) = \sum_{n=0}^{\infty} s^{n/3} f_n(t). \quad (5)$$

Card 2/4

X

32312

S/020/61/141/005/003/018

G111/C444

An effective solution of Tricomi...

By investigation of the recurrent system

$$L_{m+2} [f] = t(1-t)^2 f_{m+2}'(t) - \frac{1}{6}(1-t)(2m-1 + (2m+1)t) f_{m+2}'(t) + \\ + \frac{1}{6} m(m+2) f_{m+2}(t) = \sum_{n=0}^m a_{n/2} [(1-t)^2 f_{m-n}'(t) - \frac{1}{6}(m-n) f_{m-n}(t)].$$

(6)

which is obtained thereby, the author comes to the conclusion that in (5) one just has to sum up over the even indices. Further on he states that

$$U_0(x, y) = f_0(t) = B_0 t^{1/6} F(1/6, 1/3, 7/6; t) = I_t(1/6, 2/3), \quad (9)$$

holds, where $B_0 \Gamma(7/6) \Gamma(2/3) = \Gamma(5/6)$. By estimation of the other terms one can see that in the neighborhood of the sound line $\eta = 0$ it holds $U = U_0 + O(|\eta|)$.

In order to determine $U(x, y)$ the author uses the set-up

$$\bar{z} = \bar{U}(x, y) = \sum_{n=2}^{\infty} s^{n/3} f_n(t) = \sum_{n=2}^{\infty} (4/3)^{n/3} (-\eta)^{n/2} f_n(t), \quad (11)$$

Card 3/4

An effective solution of Tricomi...

where in order to satisfy the conditions (2) one demands

$$f_1(0) = 0, \quad \lim_{t \rightarrow 1} [2/3 (1-t) f_1'(t) - f_1(t)] = (2/3)^{1/2}, \quad (12)$$

$$f_n(0) = 0, \quad \lim_{t \rightarrow 1} (1-t)^{n-1} [n f_n'(t) - 3 (1-t) f_n(t)] = 0. \quad (13)$$

$n = 3, 4, 5, \dots$ One obtains the system (6) here as well, where now $f_0(t) = 0$. Further on one obtains $f_2(t) = B_2 t^{5/6} F(5/3, 5/6, 11/6; t)$ where $2B_2 \Gamma(1/3) \Gamma(11/6) = (4/3)^{1/3} \Gamma(1/6)$, and states that $f_3 = f_5 = f_7 = \dots = 0$. f_4, f_6, \dots are obtained successively.

AUTHOR: Kapilevich, M. B.

TITLE: Approximation of singular solutions for the Chaplygin equation

SOURCE: AN SSSR. Doklady*, v. 154, no. 2, 1964, 258-261

TOPIC TAGS: transcendental function, higher transcendental function, Dirichlet problem, Chaplygin equation, Cauchy problem, mathematical analysis, Duhamel integral

ABSTRACT: If a singular Cauchy problem

$$z(0,0) = \tau(0), \quad z_1(0,0) = v(0), \quad \eta = -(\tau(0))^2,$$

is examined for the Chaplygin equation

$$z_{\eta\eta} - z_{\eta\eta} - b(\eta) z_{\eta} = 0, \quad b(\eta) = \{\ln \sqrt{K(\eta)}\}_{\eta} = \sum_{n=0}^{\infty} b_n \eta^{n-1}$$

Card 1/4

ACCESSION NR: AP4012073

in the domain $\sigma \geq 0$ and its solution $z(\theta, \sigma)$ is sought in the integral form

$$z(\theta, \sigma) = \int_0^{\sigma} G(\theta - \alpha, \sigma) v(\alpha) d\alpha + \int_0^{\sigma} \bar{G}(\theta - \alpha, \sigma) v(\alpha) d\alpha,$$

then $G(\theta, \sigma)$ and $\bar{G}(\theta, \sigma)$ can be approximated in the vicinity of the line $\sigma = 0$ by the series

$$G(\theta, \sigma) = \sum_{n=0}^{\infty} G_n(\theta, \sigma), \quad \bar{G}(\theta, \sigma) = \sum_{n=0}^{\infty} \bar{G}_n(\theta, \sigma),$$

in which $G_0 = \bar{\gamma}$, $\sigma^{2/3} r^{-5/3}$ and $\bar{G}_0 = -\gamma_2 r^{-1/3}$ are the values for the roots of G and \bar{G} for the case $b(\sigma) = 1/3 \sigma$, $G_1 = -3/4 b_1 (\sigma^{2/3} G_0 - \bar{\gamma}_2 r^{1/3})$, $G_2 = c_0 \sigma^{4/3} G_0 + c_1 \gamma_2 \sigma^{2/3} r^{-1/3} + 4c_2 \bar{\gamma}_1 r^{1/3}$, $G_3 = 2D_0 \sigma^2 G_0 + 2D_1 \bar{\gamma}_2 \sigma^{4/3} r^{-1/3} + 8D_2 \bar{\gamma}_1 \sigma^{2/3} r^{1/3} + 2D_3 g_3(\theta, \sigma)$, and the functions

Card 2/4

ACCESSION NR: AP4012073

G_n ($n = 1, 2, 3$) have the form $\bar{G}_1 = -3/4 b_1 \sigma^{2/3} \bar{G}_0$, $\bar{G}_2 = 0$,
 $\sigma^{4/3} \bar{G}_0 + 8/9 A_1 C_2 g_3$, $\bar{G}_3 = 2D_0 \sigma^2 \bar{G}_0 - 8/5 \gamma_2 D_4 \sigma^{5/3}$ -
 $4A, D_3 \sigma^{2/3} g_3$. The constants C_n ($n = 0, 1, 2$) and D_n ($n = 0, 1, 2, 3, 4$)
depend only upon b_1, b_2 and b_3 , and the difference $g_3 = 0$ [$I_{1/2}$
 $(7/6, -1/2) - I_{1/2}(5/6, -1/2)$, $t = r/\sigma$, is denoted by $g_3(0, \sigma)$.
Each of the functions G_n and \bar{G}_n ($n = 0, 1, 2, \dots$) contains terms
converting into infinity on the characteristics $\theta + \sigma = 0$, and it is
therefore more advantageous to examine another method of iteration in
order to refine the convergence of series (4) near the line $\theta + \sigma =$
 Q . The values $x = \sigma^{1/6} \chi^{-1} u$ and $\chi = \sqrt[3]{K}$ are substituted into
(1), and the following equation is obtained

$$T(u) = u_{00} - u_{00} - \frac{1}{5} u_0 + c(u) u = 0.$$

This equation is then used as the basis for solving some special
cases. Orig. art. has: 25 equations.

TITLE: Transformation ^{1/2}operators generated by basic decompositions

SOURCE: IVUZ. Matematika, no. 1, 1966, 79-88

TOPIC TAGS: operations research, parabolic equation, linear differential equation, transcendental function

ABSTRACT: A study is made of transformation operators which may be generated by decompositions of a basis. A form of the problem is stated as follows: in a domain $X(0 < x < x_0, Y(y_0 < y < y_1))$,

the function $u(x, y, B_2)$ is sought, for which

$$L_2[u, B_2] = u_{xx} + \frac{a}{x} u_x + \frac{1}{x} B_2(x) u = 0,$$

$$u(0, y) = f(y) \in C^2(Y), u(x, y_0) = 0, f(y_0) = 0,$$

where a is a positive constant, and $B_2(x)$ is bounded and continuous in the interval $X(0 < x < x_0)$. In earlier work (Ob operatorakh preobrazovaniya svyannykh s singulyarnymi zadachami Gursa. DAN SSSR, t. 130, No. 3, Str. 487--490, 1960; 0

UDC: 517.544

Card 1/2

L 40039-66

ACC NR: AP6017269

singulyarnykh problemakh v okrestnosti nulevoy i beskonечно udalennoy osoboy kharakteristiki. DAN SSSR, t. 137, No. 6, str. 1287--1290, 1961) the author showed that if $B_2(x) = b_2 = \text{constant}$, then the solution $u(x, y, b_k)$ ($k = 1, 2$) is related to the equation

$$u(b_2) = \frac{1}{\Gamma(b_2 - b_1)} \sum_{n=0}^{\infty} \frac{(-1)^n}{n!} \left(\frac{x}{a}\right)^n \left[b_2 - b_1 + n; \frac{a(y-y_0)}{x} \right] D_x^n u(x, y, b_1).$$

The limiting case $y_0 \rightarrow -\infty$ may be expressed as

$$u_0(x, y, b_2) = \sum_{n=0}^{\infty} \frac{(b_2 - b_1)_n}{n!} \left(-\frac{x}{a}\right)^n D_x^n u_0(x, y, b_1).$$

The latter two equations are termed decompositions in descending orders about the function $u(x, y, b_1)$ (see S. Bergmann. Integral operators in the theory of linear

partial differential equations. Ergebnisse der Mathematik und ihrer Grenzgebiete. Neue Folge, H. 23, Springer-Verlag, Berlin-Göttingen-Heidelberg, 1961). Analogous formulas for the more general Goursat problem are developed and extended to the study of related types of equations such as singular equations of the parabolic type

$$z_x = z_{xx} + \frac{a}{x} z_x + c(x) z \quad [c(x) < 0],$$

as expressed by V. G. Levich (Fiziko-khimicheskaya gidrodinamika. Fizmatgiz, M. 1959) and others. Orig. art. has: 40 equations.

TITLE: Green-Adamar functions for singular Tricomi problems

SOURCE: Revue roumaine de mathematiques pures et appliquees, v. 11, no. 3, 1966, 317-324

TOPIC TAGS: wave equation, Tricomi problem, Green function

ABSTRACT: The report analyzes Green's functions of two singular Tricomi problems for the generalized wave equation

$$Q[s, a, b] = z_{aa} - z_{bb} - \frac{a}{b} z_a - b^2 z = 0.$$

Formulas evolved indicate that important integrals of the wave equation, such as the Riemann functions, Green functions, and fundamental solutions, can be expressed through confluent hypergeometric series of Humbert and Horn. Some properties of major solutions to the wave equation are analyzed. These include extension of the series beyond limits of their convergence regions, possible generalizations of the evolved algorithms, as well as an analysis of

up to 30 kv over a capacitor. The plasma concentration in the area of the first orifice at zero voltage was about $(1 \text{ to } 3) \times 10^{11}$ particles per cm^3 with an electron temperature between 0.5 and 1.0 ev. The arrangement made it possible to maintain a quasi-stationary field condition at a slowly changing voltage difference. The different characteristics of plasma flow—the stationary flow, the transitory regime, and the unstable flow—were distinguished. The first displays the dependence of the current only on the fluctuation of the arc. The transitory regime is characterized by the possibility of relaxation oscillations, which may attenuate; the current does not depend appreciably on the inter-orifice voltage. With the unstable flow, modulation of the current between the orifices takes place within the whole range of applied inter-orifice voltages; the mean current value increases slowly with the voltage. The transition from one regime to another can be effected by a change of the arc current and by the initial voltage applied to orifices, i. e. initial field strength. Both possibilities were investigated and the results plotted. The dependence of the form, period, and amplitude of the relaxation oscillations were studied in some detail. The relationships are

Cd, Pb) were 5--10 ev, and those of the second group (Mg, Al, Ni, Cu, Ag) were 20--40 ev. The experiments also yielded sufficiently accurate values of the average velocity, the energy spectrum, and the plasma composition. Mass spectroscopy has shown the presence of appreciable amounts of doubly and triply charged ions in plasmas of the second group of metals. A model of the near-cathode region, with a peaked potential in the cathode-spot plasma, is proposed to explain the origin of the high-speed plasma streams. "The authors thank L. I. 2097. AETIOLOGY AND TREATMENT OF VITILIGO (Russian text) - Kapina S. Kh. Med. Inst., Tashkent - From the Symposium: VOPR. DERM. I VENER. (Tashkent) 1957, 6 (95-102)

Eighty-six cases of vitiligo (54 male and 32 female) were under observation. Twenty-four patients had goitres, 6 hyperthyroidism, one hypothyroidism and 4 were euthyroid. Thus, 40% of the patients had changes in the thyroid gland, while 50% of the patients had general endocrine disturbances. Among 33 examined cases the blood calcium level was elevated in 25, normal in 8; blood sugar and chlorides were within normal limits. Histologic and pathologic findings showed atrophic and dystrophic changes in the epidermis, dermis and the nerve fibres, also absence or pronounced decrease in pigmentation in the basal cell layer. The treatment consisted of ultraviolet rays, administration of arsenic perorally or by injection, i. v. injections of a 0.25% solution of novocaine (from 3-4 ml. to 10 ml., the whole course consisting of 20 injections), pin-prick applications of the same solution of novocaine to the vitiligo patches (30-40-60 ml. per application, repeated 6-8 times), and homeopathic doses of iodine as indicated. The course of treatment needs to be repeated.

Abstract : A study of narcissus varieties was carried out during the period 1945-1955 at the Botanical Garden of the Institute of Botany of the Academy of Sciences of Azerbaydzhan Soviet Socialist Republic. For this purpose, the entire collection numbering 105 specimens was divided into 11 groups according to the 1950 international classification of narcissi. Description of individual varieties was carried out according to a diagram covering 20 points. Cited is a detailed characteristic of 40 of the most

TITLE: On the Problem of Determining the Thermal Contact Resistance of
Mixed Pairs

PERIODICAL: Tr. Khar'kovskogo politekhn. in-ta, 1959, Vol. 19, pp. 217-223

TEXT: The authors investigate the thermal resistance of contact surfaces of mates of different materials. Since the thermal resistance of the contact layer of the most widespread classes of surface finish (average height of micro-roughness = 2 - 15 μ) is equivalent to that of a metal layer with a thickness between 1 and 15 mm, considerable temperature gradients arise only during great heat flows which pass the contact layer, e. g. in artificially cooled units of steam and gas turbines. The thermal resistance of specimen pairs of the following materials were investigated on a special test installation: ЭЖ-1 (EZh-1) - ЭЯ1-Т (EYal-T); EZh-1 - СТ.45; St.45 - ЭЯ1-Т; St.45 - А16-Т (D16-T);

On the Problem of Determining the Thermal Contact Resistance of Mixed Pairs

3469 (EI69) - St.45 with a micro-roughness in the range of $2.5 - 10 \mu$. The tests were carried out at different compressive stresses and temperatures. The authors present a calculation formula for the determination of the thermal resistance of the contact surfaces according to the micro-geometry data of each component, thermophysical characteristics of the materials and magnitude of specific pressure. The formula includes also some factors obtained from processed test data. The calculation errors by this formula amount on the average to 4 - 6% in comparison with experimental points for plane surfaces without micro-roughness, e. g. ground on the plate. For milled surfaces, the formula gives an understated value of the contact layer thermal resistance. ✓

TITLE: Heat Transfer From the Disks of Air-Cooled Gas Turbines

PERIODICAL: Tr. Khar'kovsk. politekhn. in-ta, 1957, Vol 24, pp 111-133

ABSTRACT: Heat transfer from the rotating disks of a gas turbine to a radially oriented cooling air stream has been experimentally investigated. Experimental conditions were set by these independent parameters: disk rpm, temperature, air pressure and discharge, and gap width; the experiments have been conducted on disk models. Most experiments were devoted to investigating the relation $Nu = f(Re)$. A generalized criterial curve of heat-transfer factor vs. the Re number, disk dimensions, and its heat conductance has been deduced. Intensification of the heat transfer can be explained by a higher stream turbulence in the movable-wall diffuser channel.

TITLE: Heat Conductivity of a Layer, Formed Through Projections
of Surface Roughness (Teplovaya provodimost' sloya,
obrazovannogo vystupami sherokhovatosti)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy - Energetika,
1958, Nr 9, pp 77-89 (USSR)

ABSTRACT: When two rough surfaces are placed together, there is
direct contact only between individual projections of
the surface roughness. Consequently, the actual
contact surface is always essentially smaller than
nominal one (of the order 10^{-2} - 10^{-5} of the nominal
one). As a result of the incomplete contact, the
thermal conductivity of the metallic contact is
commensurate with the conductivity of the gas inter-
layer. The total conductivity of a layer formed by the
roughness projections and filled by a gaseous medium,
can be computed on the basis of the assumptions and

Heat Conductivity of a Layer, Formed Through Projections of Surface Roughness

- solutions examined in this paper. The author also works out formulae for computing the heat conductivity of a simple contact layer of steam from homologous materials, as well as a formula for determining the contact resistance of various materials. The paper examines the effect on thermal conductivity of roughness, specific compression pressure, the physical properties of materials and the temperature of the contact layer. Each pair of objects was studied at 2-3 temperature values of the contact layer with loads of 40-500 kg/cm² (and in special tests up to 1200 kg/cm²). In accordance with the accepted method, only one parameter was varied in a test series - specific compression pressure - the average temperature of the contact layer remaining constant. The comparative data resulting from computed and empirical determination of the contact resistance of the mixed pairs confirm the accuracy of the computational formula. Computational errors for the 5 mixed pairs studied did not exceed 10%. Calculation

Heat Conductivity of a Layer, Formed Through Projections of Surface Roughness

according to the formulae indicated gives the minimum thermal resistance of the contact layer, which is conditioned by the micro-roughness. The presence of a macro-unevenness can cause considerable increase in the contact resistance. There are 18 graphs, 1 sectional diagram, 1 table and 10 references, 8 of which are Soviet, 1 English and 1 American.
